
QBPopupMenu

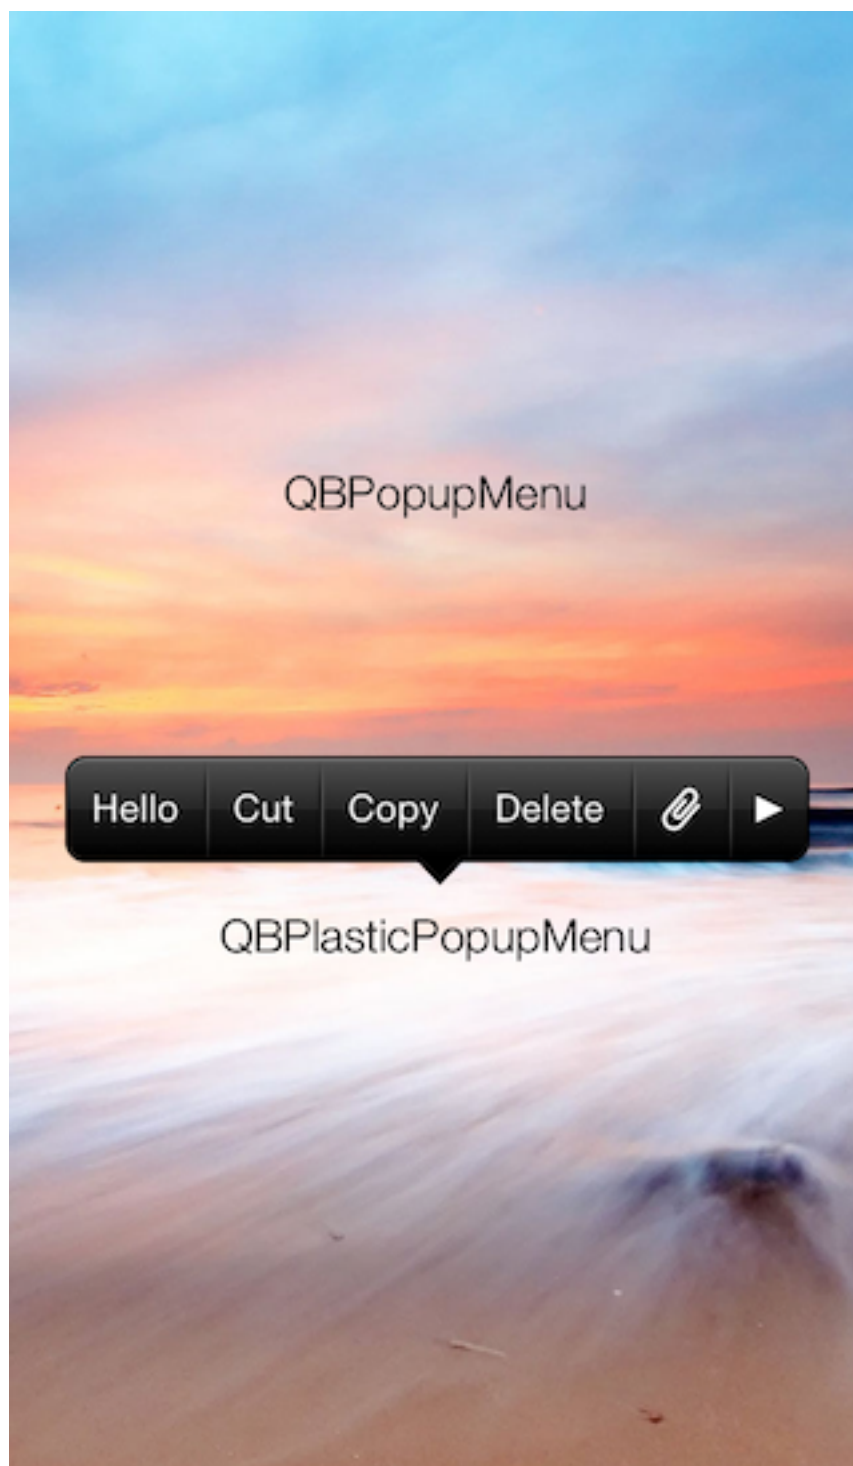

Customizable popup menu for iOS.

QBPopupMenu version 2.0 is now available.

Its appearance is similar to [UIMenuController](#) of iOS 7, and it has several new features.

Screenshot

Installation

QBPopupMenu is available in CocoaPods.

```
1 pod 'QBPopupMenu'
```

If you want to install manually, download this repository and copy files in QBPopupMenu directory to your project.

Feature

Customizable Appearance

QBPopupMenu is highly customizable, so you can create your own popup menu.

The simple way to customize is set `color` and `highlightcolor` property of QBPopupMenu. If you want to customize deeply, you should create a subclass of QBPopupMenu and override some drawing methods.

QBPlasticPopupMenu class in this repository is a good example of subclassing.

Auto Pagination

If you add many items to QBPopupMenu, it create pages and paginator automatically.

Auto Bounding

QBPopupMenu automatically adjust its frame depending on the frame of target view.

Example

```
1 QBPopupMenuItem *item = [QBPopupMenuItem initWithTitle:@"Text" target:
    self action:@selector(action:)];
2 QBPopupMenuItem *item2 = [QBPopupMenuItem itemWithImage:[UIImage
    imageNamed:@"image"] target:self action:@selector(action:)];
3
4 QBPopupMenu *popupMenu = [[QBPopupMenu alloc] initWithItems:[item,
    item2]];
5
6 [popupMenu showInView:self.view targetRect:... animated:YES];
```

License

QBPopupMenu is released under the **MIT License**, see *LICENSE.txt*.
